

Temperature and Humidity data – API Documentation

This document explains the process of recording a television program using API requests.

XML Request

```
<dailyData>
  <date>2015-06-01</date>
  <hourlyData>
    <time>10:00</time>
    <device>
      <id>34</id>
      <temperature>70</temperature>
      <humidity>11</humidity>
    </device>
    <device>
      <id>35</id>
      <temperature>72</temperature>
      <humidity>12</humidity>
    </device>
    ...
  </hourlyData>
  <hourlyData>
    <time>11:00</time>
    <device>
      <id>34</id>
      <temperature>71</temperature>
      <humidity>10</humidity>
    </device>
    ...
  </hourlyData>
  ...
</dailyData>
```

Consolidated response data for all devices

Gets a request for the temperature and humidity data from all devices.

Element	Description	Type
dailyData	Temperature and humidity data for one day	dailyData element

[dailyData](#)

Gets the temperature and humidity data for one day

Element	Description	Type	Notes
date	The date when the temperature data was taken	string	Format is YYYY-MM-DD
hourlyData	Temperature and humidity data for one hour	Array of hourlyData	

[hourlyData](#)

Gets the temperature and humidity data for one hour

Element	Description	Type	Notes
time	The local time when the temperature data was taken	string	Format is HH:MM
device	One or more device objects with data from each device	Array of device	

[device](#)

Gets the temperature and humidity data from a device

Element	Description	Type
id	The device's ID	number
temperature	The measured temperature in degrees Fahrenheit	number
humidity	The measured temperature in percentage	number
